

Easy-mix Boron

ZenaB™ prevents and / or corrects boron deficiencies to maximize plant growth by supporting strong cellular structure, fruit and seed development and plant maturity. ZenaB also supports phosphorus and potassium absorption.

Available in 2.5, 5 and 275 U.S. gallons. Also available in bulk.

INGREDIENTS AND DIRECTIONS FOR USE

SOIL APPLICATION: Add to fertilizer or mix with water.

SOIL RATE:

2X2	1-2 quarts per acre
SIDEDRESS	1-2 quarts per acre
TOPDRESS	1-2 quarts per acre

GUARANTEED ANALYSIS

Boron (B) 10%

Derived from: Boric Acid

WARNING: Contains Boron. Do not use on Boron sensitive crops. Use only according to manufacturer's directions.

Always read and follow label directions. Use in accordance with recommendations of a qualified individual or institution or an approved nutrient management plan and / or soil and / or tissue test. Always test for compatibility prior to application. May cause plant damage if applied above the recommended rates. Some crops may be injured by application of boron. Do not use on boron sensitive crops. Do not apply when crop is excessively stressed for moisture or during periods of high temperatures. Use only as a supplement to a regular nutrient management program.

FOLIAR APPLICATION: Fill spray tank with water prior to adding fertilizer or other products. Repeat applications may be beneficial. Use of a surfactant may enhance leaf coverage and increase nutrient absorption.

FOLIAR RATE:

FOLIAR	1-2 pints per acre

THE VALUE OF BORON

Photo courtesy of International Plant Nutrient Institute

Most fertilizer programs provide macronutrients to stimulate growth: nitrogen, phosphorus, and potassium. Micronutrients such as calcium, manganese, zinc, boron and copper are needed in smaller amounts, but are just as critical to plant growth.

Boron plays an important role in a number of plant processes. Most importantly it supports cell wall structure and cell division. Boron helps move sugars into the growing plant parts. It is also critical to developing pollen grains, vigor and overall plant reproduction.

IS YOUR SOIL BORON DEFICIENT?

A soil test is the best tool to determine overall soil profiles. However, certain types of soil are more likely to experience boron deficiencies.

- Sandy soil
- High clay, iron or aluminum oxide minerals
- Low organic / residue material soils
- High pH soils / acidic soils

Add ZenaB to your mix to maximize your fields' potential.

BORON PROMOTES PLANT DEVELOPMENT AND ULTIMATELY, YIELDS

Missing it? You'll notice:

- Overall stunted growth
- Reduced root structure
- Reduced flowering and pollination
- Reduction in seed setting

Boron deficiencies are hard to notice, but it is the second most deficient soil nutrient next to zinc!
